

Very close ice is still present in the north-east part of Kleines Haff.

### **Southern Baltic Sea**

In the Bight of Greifswald there is open 5-10 cm thick brash ice in the northernmost area. Peenestrom is ice-free, but some rotten ice is present in Achterwasser. In Kleines Haff there is very close, partly rafted, 5-10 cm thick ice at the north-eastern coast, else ice-free.

### **Outlook**

At daily air temperatures up to 9°C and temperatures around 2°C at night, ice remnants will melt within the next two to three days.

Careful navigation is still requesting due to dispersed buoys and in the ice covered areas.

**This is the last German Ice Report for the time being.**
