

German Ice Report - No. 24

2018-03-17

AA 11/10

The remaining ice has accumulated near the southern shores.

North Sea:

In the area around Sylt open water occurs locally.

Southern Baltic Sea

Between Rügen and Hiddensee open water and thin open, rotten ice occur in few places, else ice free. In the Greifswalder Bodden there is a very narrow belt of open to very open ice at the coast in the south-western part, else it is mostly ice free. In the German part of the Szczecin Lagoon, very open to open thin ice and open water occur locally in the southern parts.

Outlook

The remaining ice will stay near the coast. There may be light new ice formation in shallow and sheltered areas.

Restrictions:

16.03.2018: Minimum ice class E1 and 1000 kw for the southern Peenestrom and on the Kleines Haff has been cancelled.
